JOBLINK

JOB PORTAL

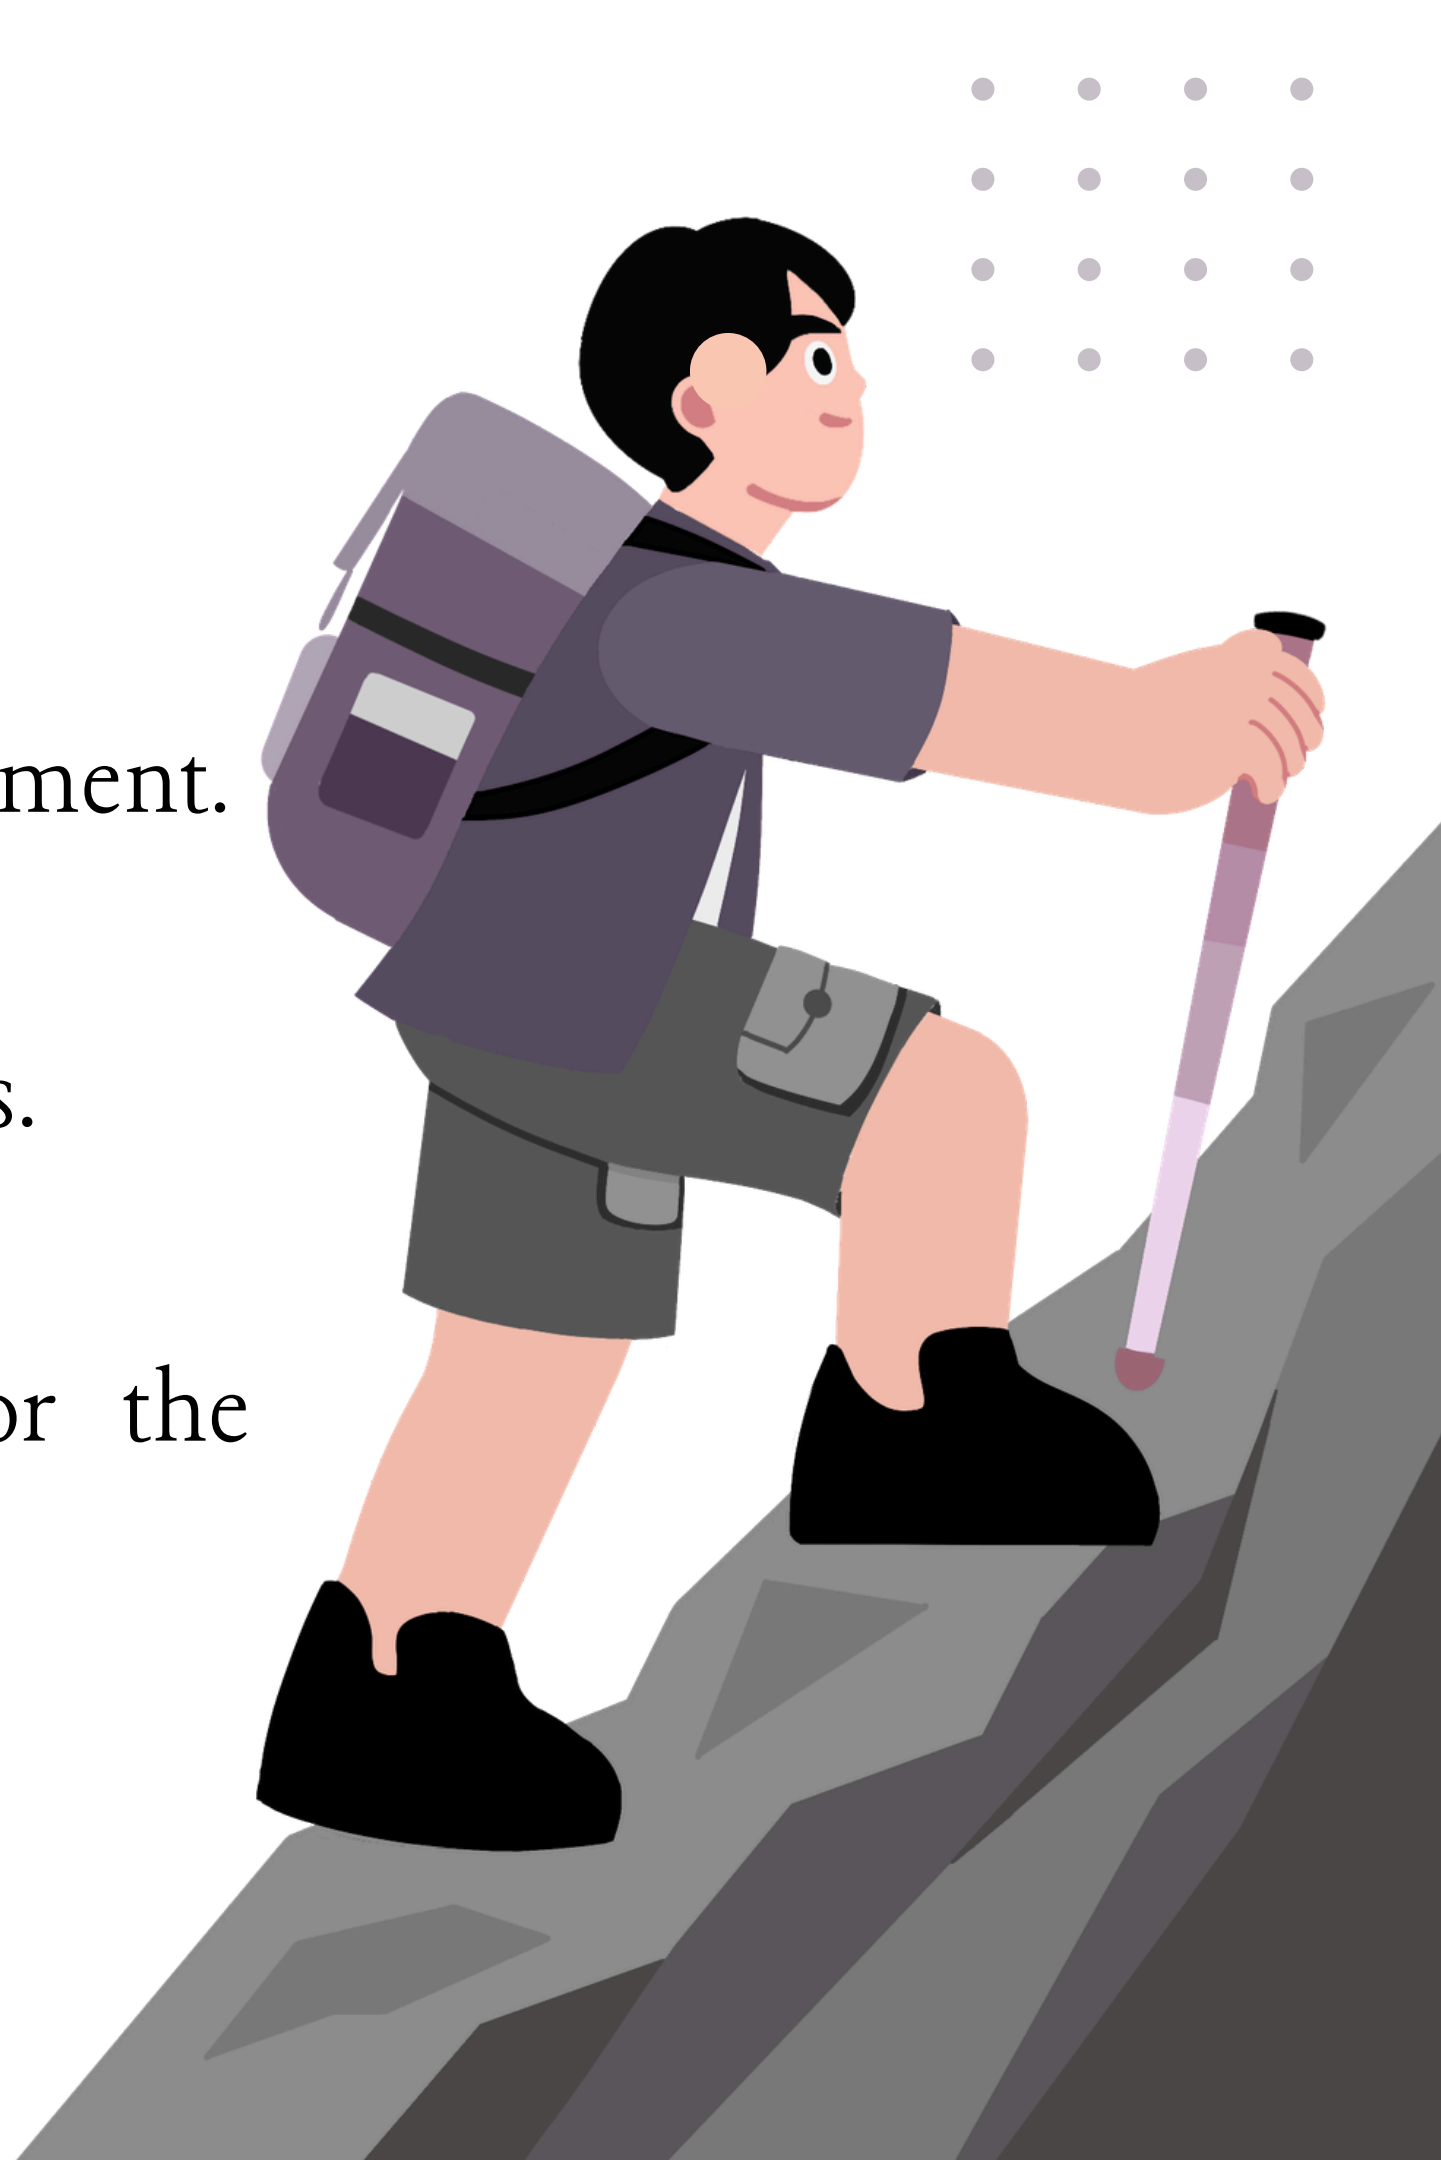

BACKEND SYSTEM

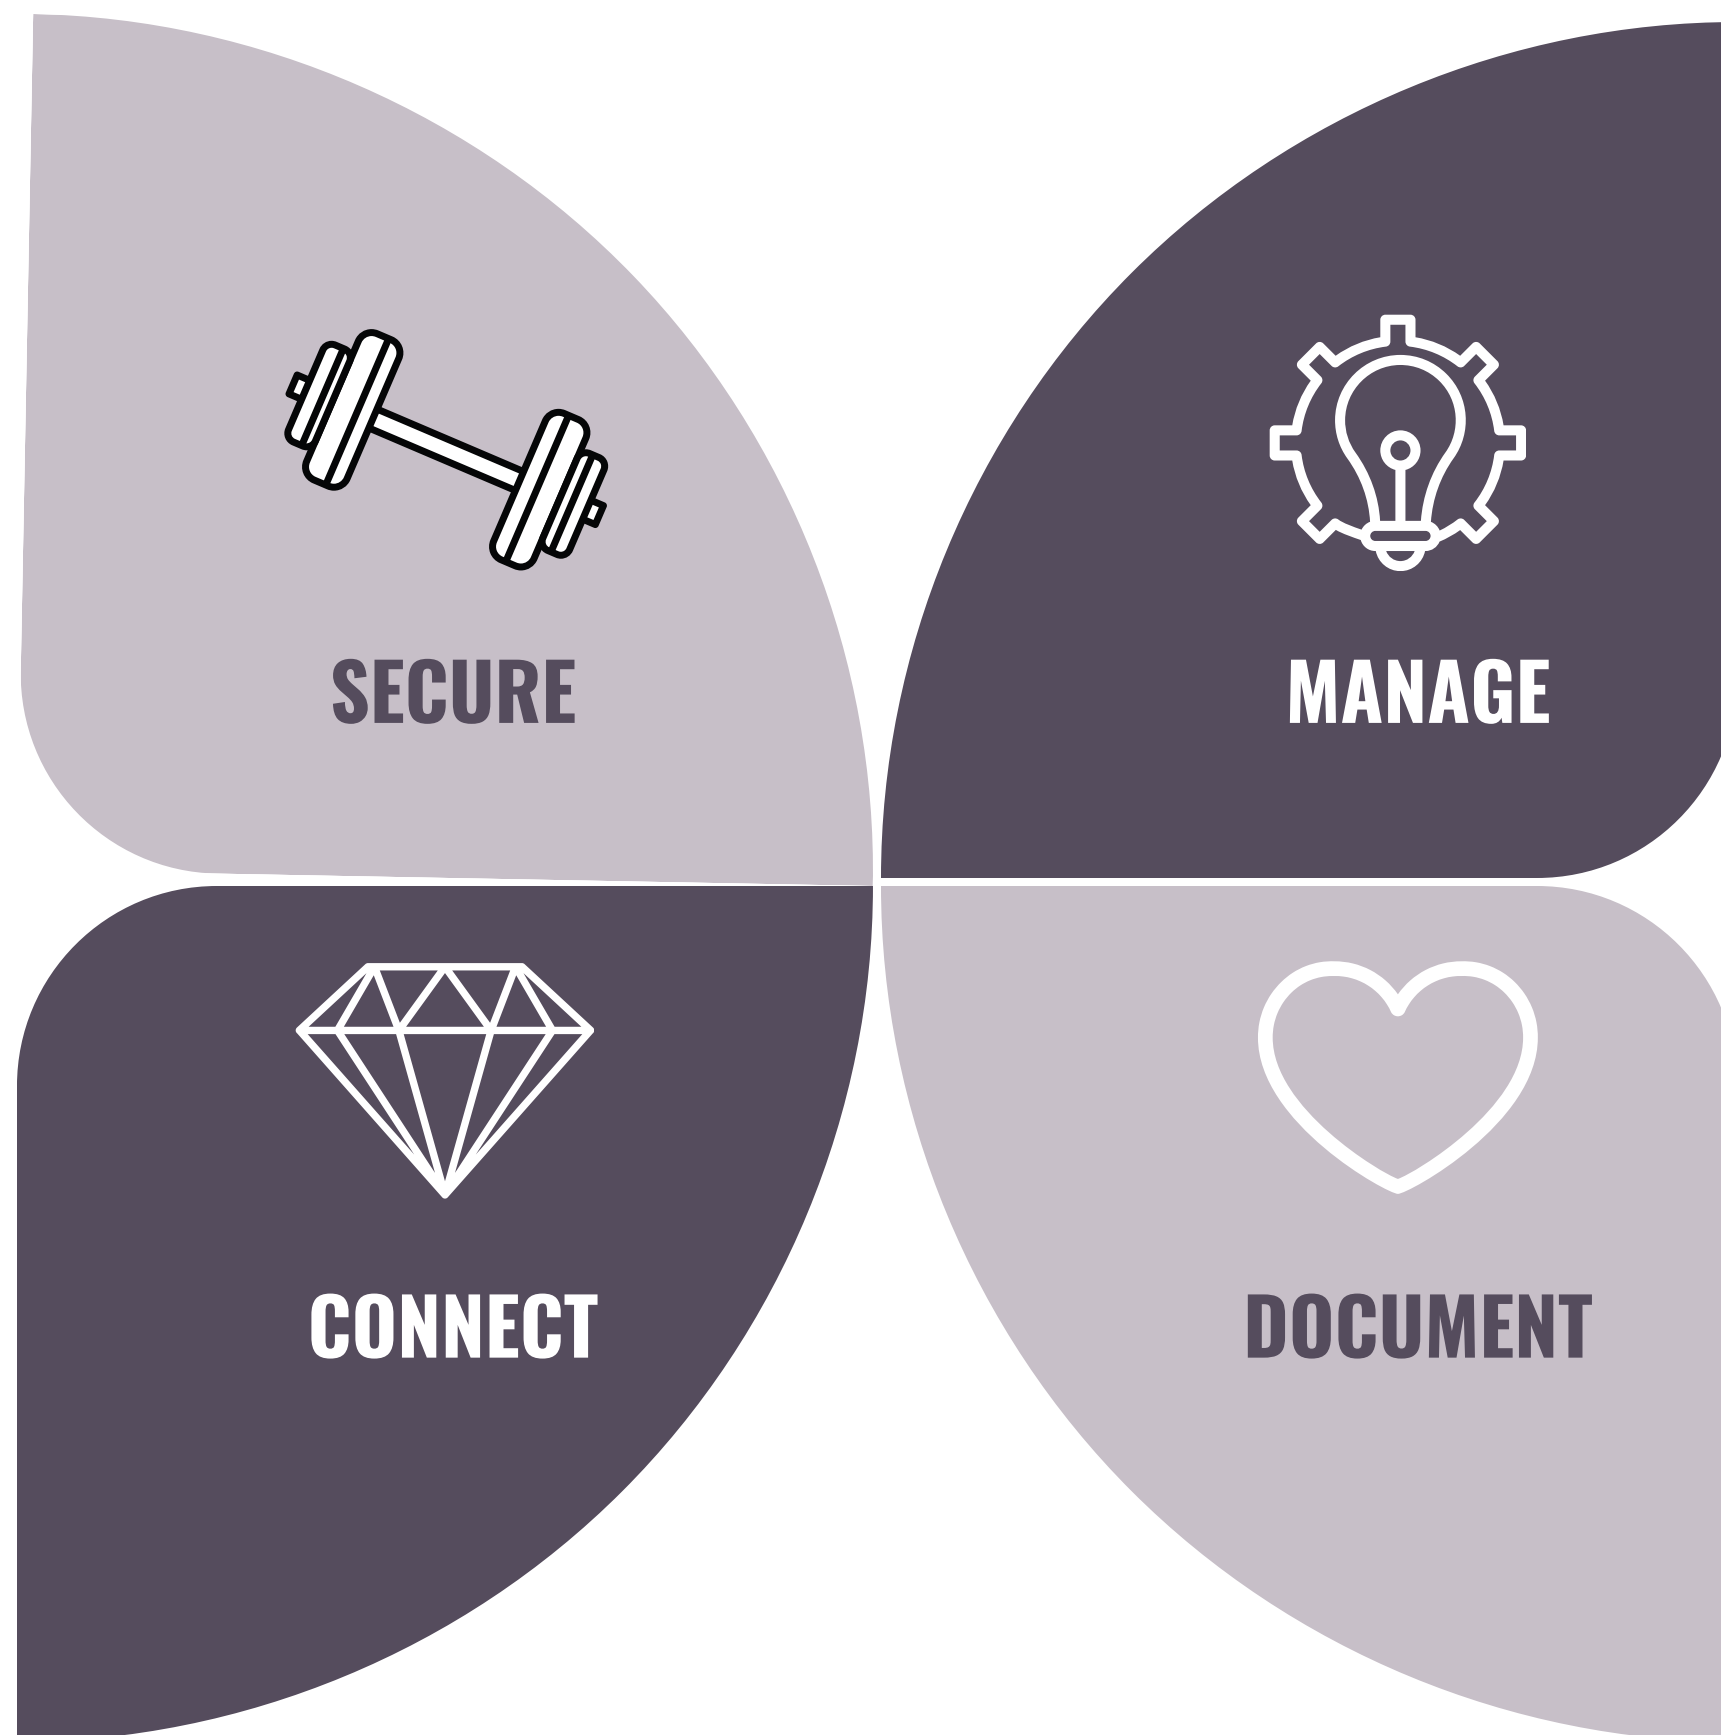

PROBLEM STATEMENT

- Job posting and applications need centralized management.
- Resume and interview tracking can be difficult.
- Employers need an efficient way to manage candidates.

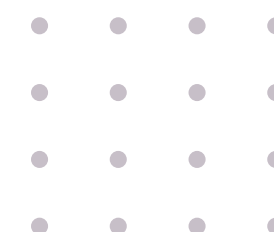

Solution: JobLink provides one backend system for the complete job portal workflow.

OBJECTIVES

- Build a REST API backend.
- Manage users, jobs and resumes.
- Handle job applications and statuses.
- Support employers and admins.
- Provide notifications and interviews.
- Add API documentation and real-time communication.

TECHNOLOGY STACK

- Backend: Node.js, Express.js
- Database: MongoDB Atlas, Mongoose
- Security: JWT, bcryptjs
- Upload: Multer
- Real-Time: Socket.io
- Documentation: Swagger
- Testing: Postman
- Deployment: Render

SYSTEM FEATURES

- User Registration & Login
- JWT Authentication
- Job CRUD & Search
- Resume Upload
- Job Applications
- Application Status
- Employer Management
- Admin Management
- Notifications & Interviews

DATABASE & API

MongoDB Atlas: joblink_db > >

Collections: Users, Jobs, Resumes,
Applications, Notifications, Interviews

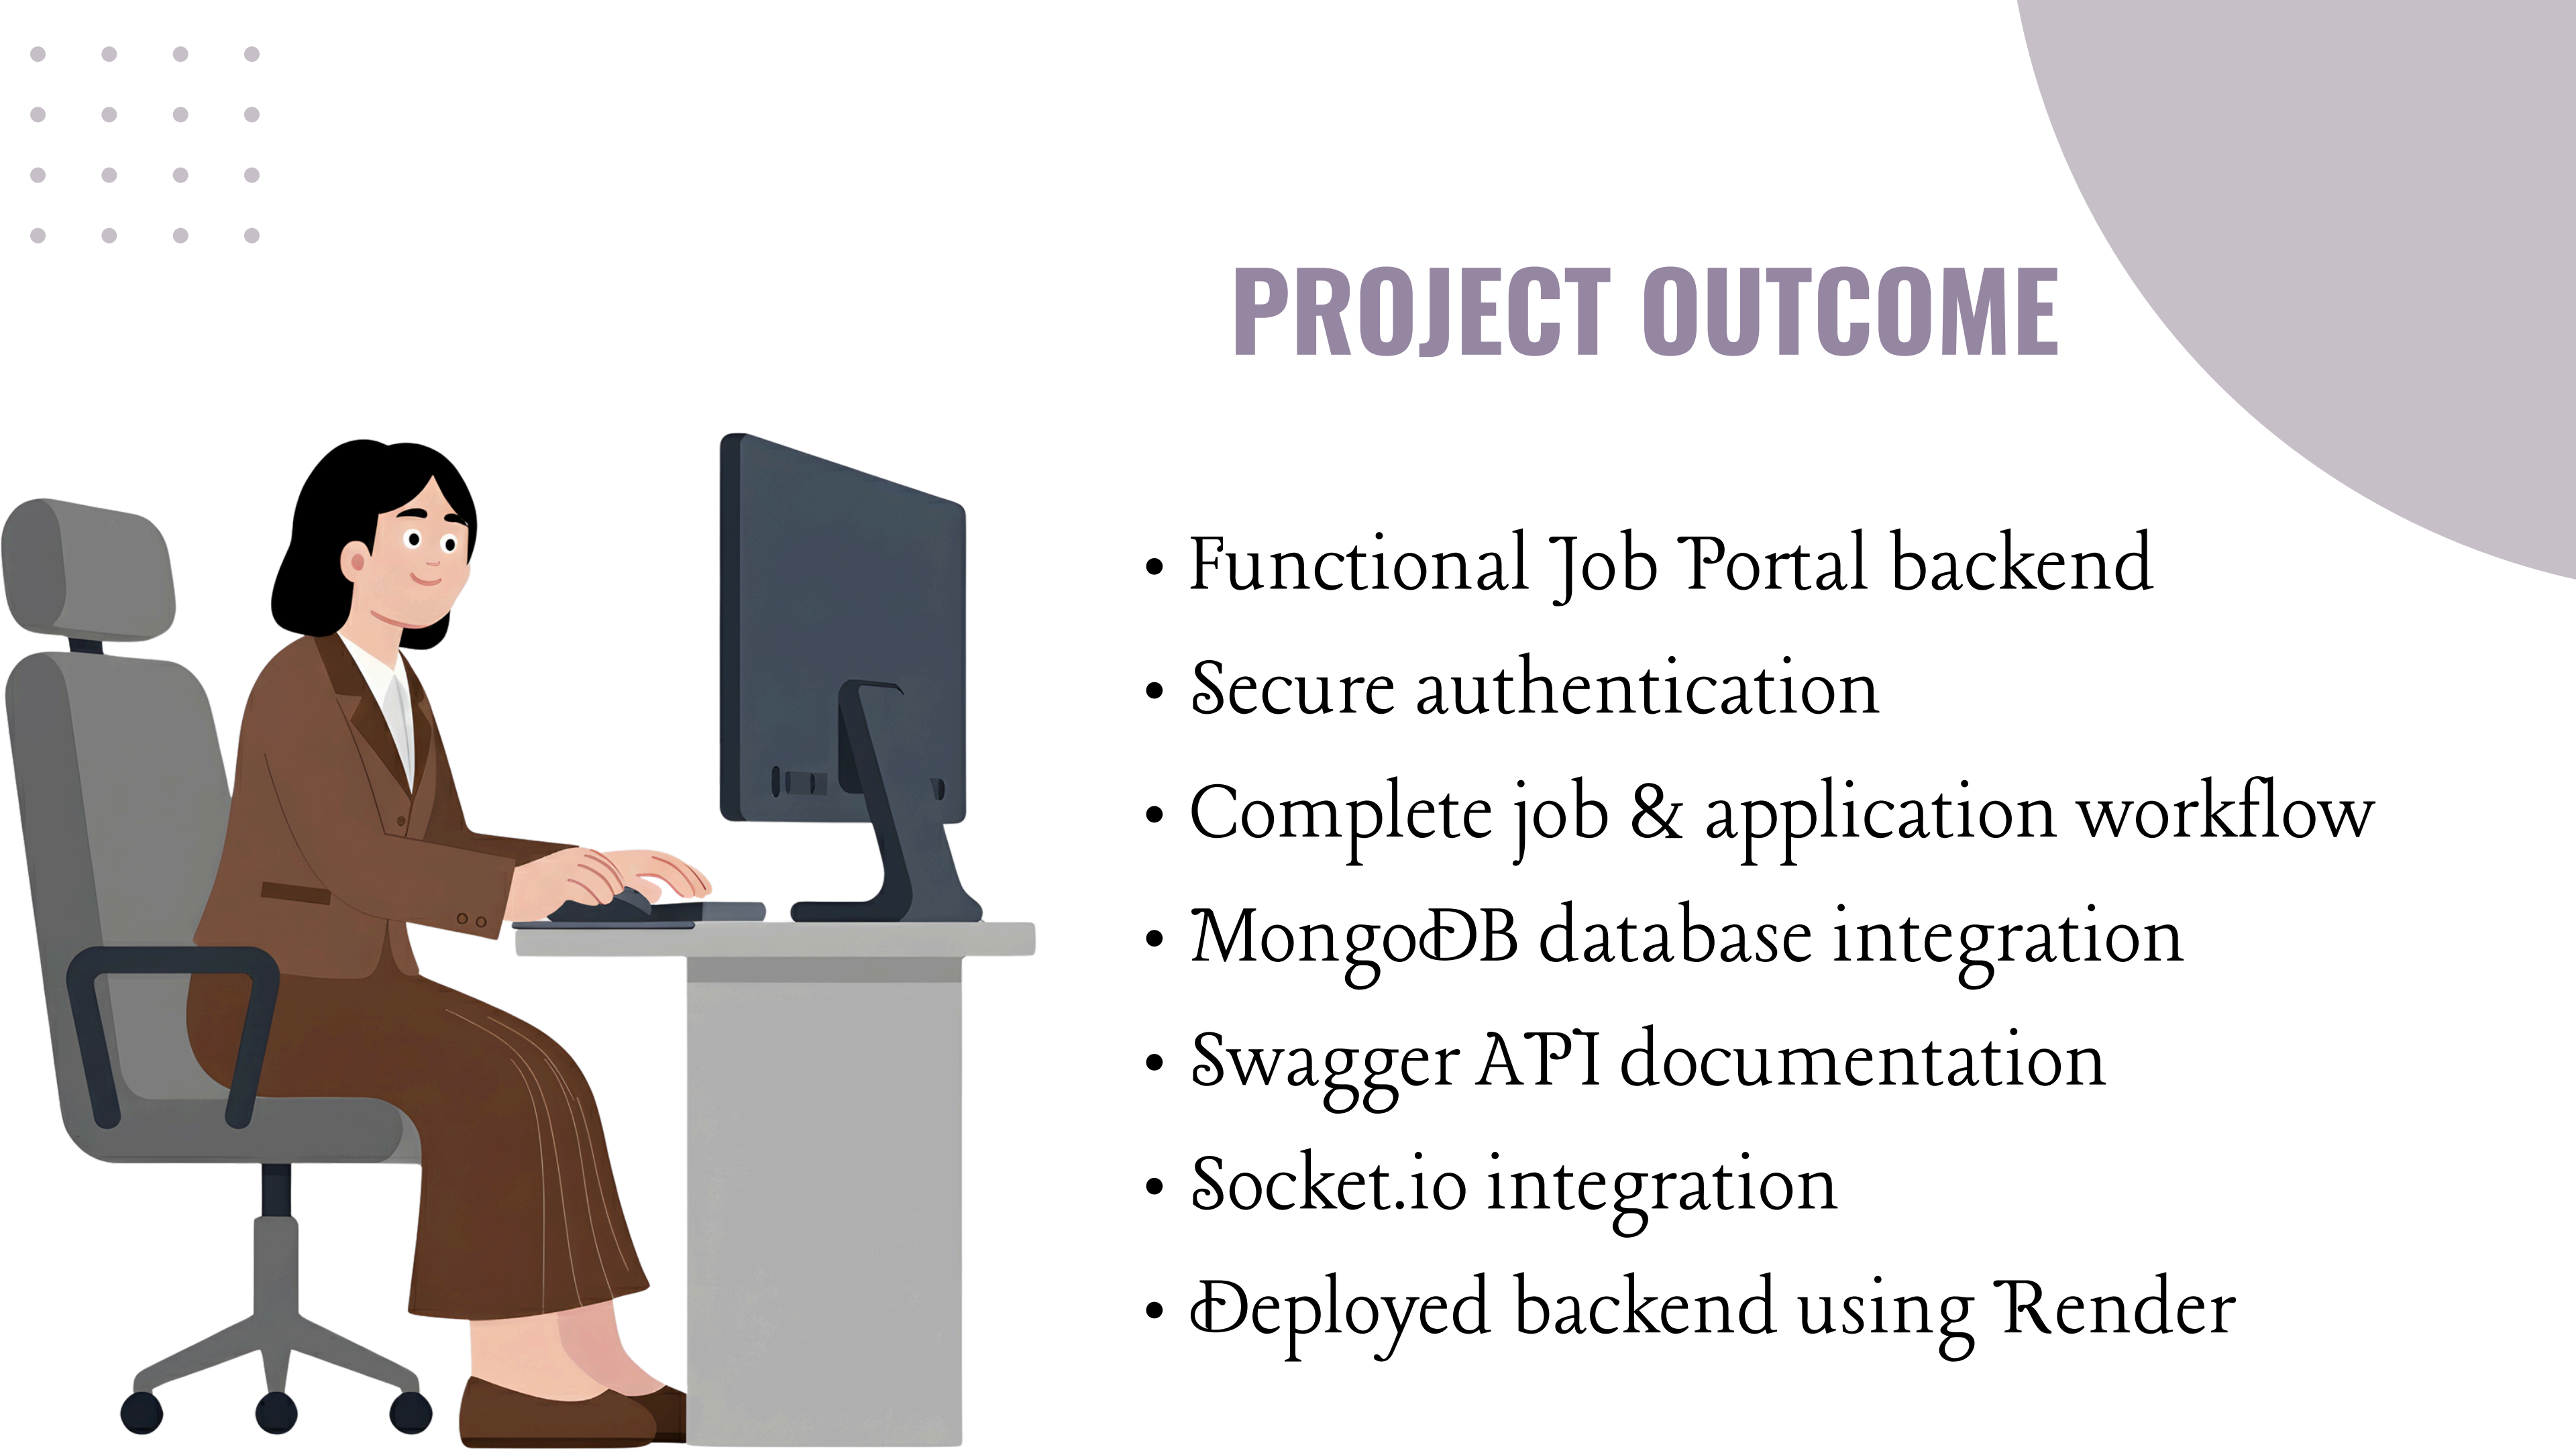

API: REST APIs built with Express.js and
Mongoose.

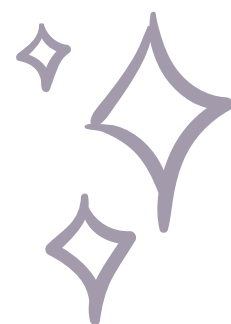

TESTING & INTEGRATION

- Postman: API testing
- Swagger: Interactive API documentation
- Firebase: Admin SDK integration
- Socket.io: Real-time connection handling
- GitHub: Version control
- Render: Backend deployment

PROJECT OUTCOME

- Functional Job Portal backend
- Secure authentication
- Complete job & application workflow
- MongoDB database integration
- Swagger API documentation
- Socket.io integration
- Deployed backend using Render

THANK
YOU
